1. What this module does

Confirming a quotation in standard Odoo creates a delivery order and stops there. Somebody then has to open the transfer, click **Validate**, go back to the order, click **Create Invoice**, open the draft invoice and click **Confirm** — four extra clicks and three screens for an order that never needed a human decision.

This module adds three checkboxes to the warehouse form. When they are on, pressing **Confirm** on a sales order that ships from that warehouse also:

1. validates the delivery in full,
2. creates the customer invoice,
3. posts that invoice.

Nothing else in the Sales app changes. There is no new menu, no new screen, no new button and no new model — the automation runs invisibly behind the existing **Confirm** button.

The setting is **strictly per warehouse**. There is no per-order override and no exception list: every quotation confirmed from an automatic warehouse is automated the same way.

2. Installation

1. Copy the `sale_warehouse_auto_fulfillment` folder into your Odoo addons path.
2. In Odoo, go to **Apps**, click **Update Apps List**, then search for Sale Warehouse Auto Fulfillment

and click **Activate**.

3. The module depends on **Sales, Inventory** (through `sale_stock`) and **Invoicing** (`account`). Odoo installs them automatically if they are missing.

No new access group is created. Whoever can edit a warehouse today (Inventory administrators) can turn the automation on; whoever can confirm a sales order today triggers it.

3. Configuration

Go to **Inventory > Configuration > Warehouses** and open a warehouse. Next to the **Short Name** (`code`) field you will find three new checkboxes:

Checkbox	Technical field	Default
Ship Automatically	<code>auto_ship</code>	unchecked
Create Invoice Automatically	<code>auto_invoice_create</code>	unchecked
Confirm Invoice Automatically	<code>auto_invoice_confirm</code>	unchecked

All three are off after installation, so installing the module changes nothing until you deliberately switch something on.

Important: only enable **Ship Automatically** on warehouses whose stock figures you trust. Automatic shipping performs **no availability check** — see section 5.

4. Daily use

There is no new workflow to learn.

1. Create a quotation as usual (**Sales > Orders > Quotations > New**).
2. Check that **Warehouse** on the Other Info tab points at the automated warehouse.
3. Click **Confirm**.

Depending on the switches, when the page comes back you will see:

- the **Delivery** smart button showing a transfer in state **Done**,
- the **Invoices** smart button counter increased by one,
- that invoice already in state **Posted**.

If something went wrong, the order is still a **Quotation** and a blocking message explains why (section 6).

5. The three switches in detail

Ship Automatically (`auto_ship`)

Validates the order's delivery immediately after the order is confirmed:

- **all lines, full ordered quantity** — no partial shipping,
- **no backorder** is ever created,
- **no stock availability check** — if you sell 10 units of a product with 0 on hand, the transfer is still set to Done and on-hand stock becomes **-10**. This is intentional, not a bug.

Create Invoice Automatically (`auto_invoice_create`)

Runs exactly what the manual **Create Invoice** button runs, so each product keeps its own **Invoicing Policy**:

Product invoicing policy	<code>auto_ship</code> on	<code>auto_ship</code> off
Ordered quantities	invoice for the ordered quantity	invoice for the ordered quantity
Delivered quantities	invoice for the delivered quantity	nothing to invoice — skipped silently

"Nothing to invoice" is not a failure. When there are no invoiceable lines, the step is skipped, a note is written to the order's chatter ("Automatic invoicing skipped: there was nothing to invoice on this order at confirmation time.") and the confirmation succeeds normally.

Worked example — a warehouse with `auto_invoice_create` on and `auto_ship` **off**, and an order with two lines:

Line	Policy	Qty	Result
Standard Widget	Ordered	5 × 45.00	invoiced → 225.00
Custom Fixture	Delivered	2 × 320.00	not invoiced (0 delivered)

One draft invoice is created, for **225.00**. The Custom Fixture line stays "To Invoice" until somebody delivers it.

If the order had contained only the Custom Fixture line, no invoice would be created at all and the chatter note would appear instead.

Confirm Invoice Automatically (`auto_invoice_confirm`)

Posts the invoice that this same automation run has just created.

It has no independent effect. With `auto_invoice_create` off there is nothing for it to post, so a warehouse with only this switch on behaves exactly like standard Odoo. It never touches invoices created by anyone else, and it never posts an older draft invoice.

Invoices are posted, **never emailed**.

6. What happens when something fails

A real error means one of these three:

- the delivery could not be validated (for example a lot/serial number is required, or Odoo asked for a confirmation wizard),
- the invoice could not be created,
- the invoice could not be posted (for example the customer has no receivable account).

When one of them happens, the whole run — **including the order's state change to Confirmed** — is rolled back inside a single database savepoint. The result is all-or-nothing:

- the order goes back to **Quotation**,
- no delivery order is left behind,
- no invoice, draft or posted, is left behind.

You then get a blocking message naming the stage and the underlying reason, for example:

Automatic fulfillment failed for S00042 on warehouse Main Warehouse.

Stage: automatic invoice posting Reason: The customer has no receivable account.

Nothing was kept: the order stays a quotation, no delivery was validated and no invoice was created. Fix the reason above and confirm the order again, or turn the automation off on the warehouse to confirm it manually.

Because the order itself is rolled back, it carries **no trace** of the attempt. The failure is instead written to `ir.logging` through an independent database transaction, so it survives the rollback. Developers can read it from the shell or from **Settings > Technical > Logging** (developer mode) by filtering on `name = sale_warehouse_auto_fulfillment`.

7. Demo data walkthrough

Install the module in a database **with demo data** to get a ready-made playground.

Warehouses

Warehouse	Code	Ship	Create invoice	Post invoice
Main Warehouse	WH	on	on	on
Project Warehouse	PROJ	off	off	off

Products

Product	Invoicing policy	On hand in WH
Standard Widget	Ordered quantities	150
Office Chair	Ordered quantities	60

Custom Fixture	Delivered quantities	0
----------------	----------------------	---

Quotations — six drafts are pre-created, each with the scenario written in its **Customer Reference** field:

Scenario	Order content	What to do
1 — full auto flow	Standard Widget ×5, Office Chair ×2	confirm as-is
2 — ship only	Standard Widget ×12	first leave only Ship Automatically on _{WH}
3a — invoice create only	Office Chair ×4	first leave only Create Invoice Automatically on _{WH}
3b — silent skip	Custom Fixture ×2	same switches as 3a; no invoice is created, a chatter note appears
4 — manual baseline	Standard Widget ×6, Project Warehouse	confirm as-is, nothing is automated
5 — negative stock	Custom Fixture ×10	confirm as-is; delivery is Done and on-hand becomes -10

Scenarios 2, 3a and 3b need you to change the _{WH} switches first, because the switches live on the warehouse and not on the order. Remember to set all three back on afterwards if you want to replay scenario 1 or 5.

8. Field reference

Model `stock.warehouse` (extended):

Field	Type	Label	Meaning
<code>auto_ship</code>	Boolean	Ship Automatically	validate the delivery in full on order confirmation
<code>auto_invoice_create</code>	Boolean	Create Invoice Automatically	run standard invoice creation on order confirmation
<code>auto_invoice_confirm</code>	Boolean	Confirm Invoice Automatically	post the invoice this run just created

Model `sale.order` (extended): no new fields. `action_confirm()` is overridden; with all three warehouse switches off it is a plain pass-through to standard Odoo.

Model `ir.logging` (reused, not extended): automation failures are stored here.

9. Limitations

Stated honestly, these are deliberate design decisions, not bugs:

- **No partial shipping.** Automatic delivery is all-or-nothing for the whole order. If you need to ship part of an order, turn `auto_ship` off for that warehouse.
- **No stock availability check.** Negative stock is intended behaviour on automatic warehouses.
- **Lot/serial-tracked products are out of scope.** If validation cannot complete because a lot or serial number is required, that is a real failure: full rollback and a blocking message, not a silent skip.
- **No per-order override and no exceptions list.** The switches are per warehouse only.
- **No invoice emailing.** Invoices are posted, never sent to the customer.
- **No automation history on the order.** A rolled-back order shows no trace of the attempt; auditability is through `ir.logging` only, which is developer-facing.
- **Nothing is retried.** A failed confirmation must be confirmed again by hand once the cause is fixed.

10. Troubleshooting

Symptom	Cause	What to do
Confirm behaves like standard Odoo	the order's warehouse has <code>auto_ship</code> and <code>auto_invoice_create</code> both off	check Other Info › Warehouse on the order, then the warehouse form
Only <code>Confirm Invoice Automatically</code> is on and nothing happens	it has no independent effect	also switch on Create Invoice Automatically
Delivery is Done but no invoice was created	every line uses the Delivered quantities policy and <code>auto_ship</code> is off	switch on Ship Automatically , or invoice manually
Chatter says "Automatic invoicing skipped"	there was genuinely nothing to invoice	expected behaviour; invoice manually once quantities are delivered
Order stays a Quotation with a blocking message	a real error at one of the three stages	read the Reason line, fix it, confirm again
Stock went negative	<code>auto_ship</code> performs no availability check	expected; only enable it on warehouses with trusted stock figures
I need the failure history	the order was rolled back, so it has none	developer mode › Settings › Technical › Logging , filter <code>name = sale_warehouse_auto_fulfillment</code>
