

OdoMate HR Suite — User Guide

Technical name: `odomate_hr_bundle` · Version 19.0.1.0.0 · License LGPL-3

Table of contents

1. What this module does
2. What gets installed
3. Installation
4. The menu layout you get
5. Permissions
6. Keeping the layout after upgrading one member module
7. Uninstalling
8. Limitations

1. What this module does

`odomate_hr_bundle` is a meta-module. It contains no models, no fields, no wizards, no computed values, no automation and no permission records of its own. It does exactly two things:

1. It **installs the eight OdoMate HR modules** as a single unit, so you tick one box in Apps instead of eight.
2. It **groups their menus** into an **HR Suite** folder in the Employees app and a second **HR Suite** folder under **Employees → Configuration**, so the top level of the Employees app does not grow eight new entries.

Every screen, record, button and permission you see afterwards comes from the member modules. This module adds none of its own.

2. What gets installed

Module	Title on the Store	What it does
<code>odomate_hr_employee_info_06092026_2</code>	Employee Dependants & Identity Documents	Family members, dependants and identity document details on the employee record
<code>odomate_hr_documents</code>	Employee Document Expiry Tracking	Documents that expire, with advance warning and a renewal history

<code>odomate_hr_custody</code>	Employee Custody Management	Company property held by employees, with request, approval and return
<code>odomate_hr_transfer</code>	Employee Transfer	Moves between departments, locations or companies, keeping the history
<code>odomate_hr_leave_email</code>	Time Off Requests by Email	Turns an incoming email into a time-off request
<code>odomate_hr_notices</code>	HR Notices, Announcements & Acknowledgements	Company announcements and personal reminders, with a count in the top bar
<code>odomate_hr_dashboard</code>	Employee Turnover & Absence Dashboard	Headcount, turnover, absence concentration and pending approvals in one screen
<code>odomate_hr_resignation</code>	Employee Resignation & Clearance	Resignation requests, a clearance checklist and an exit interview

`hr` (Employees) is also declared as a dependency, because the two HR Suite folders are attached to the Employees app menu.

`odomate_hr_leave_email` contributes no menu of its own — it is configured through an incoming mail alias and the Time Off settings, not through a dedicated screen. That is why eight modules produce ten re-parented menu entries rather than eleven.

3. Installation

1. Copy `odomate_hr_bundle` into your addons path, together with the eight member modules if they are not already there.
2. **Apps → Update Apps List.**
3. Search for **OdoMate HR Suite**, then click **Install**.

Odoo resolves the dependency list and installs any member module that is missing. On a database where some members are already installed, only the missing ones are added — **already-installed members and all of their data are left untouched**. This is standard Odoo dependency behaviour, not something this module implements.

No configuration step follows the install. There is nothing to set up.

4. The menu layout you get

However, if you later upgrade **a single member module on its own**, that member's own XML reloads and puts **its own** menu back at its native top-level position. Only that member is affected; the other nine entries stay where they are.

To restore the grouping: upgrade `odomate_hr_bundle` afterwards (**Apps → OdoMate HR Suite → Upgrade**). Nothing else is needed, and the upgrade is safe to repeat.

7. Uninstalling

Nothing is destroyed when you uninstall this module.

The `parent_id` field on a menu is declared `onDelete="restrict"` in Odoo's own source, which means uninstalling the bundle **can never delete a member module's menu as a side effect**. The eight member modules and all of their data remain installed and keep working individually.

What uninstalling does **not** do is move the ten entries back to their original positions. The `parent_id` values the bundle wrote landed on records owned by the member modules, so the bundle has nothing of its own to revert. Each member menu returns to its native position the next time **that member's own module** is upgraded or reinstalled.

One detail is **unverified and we are flagging it rather than guessing**: whether the two HR Suite folder records that this module owns are themselves removed on uninstall, or whether the `restrict` constraint leaves them behind as empty folders because a still-installed member's menu still points at one. We could not confirm the per-record behaviour of Odoo's uninstall routine from the source available to us, so we state it neither way. If empty HR Suite folders do remain after an uninstall, they are harmless and can be deleted manually in developer mode under **Settings → Technical → User Interface → Menu Items**.

8. Limitations

- **Menu placement only.** This module adds no feature of its own. If a member module lacks a capability, installing the bundle does not add it.
- **Re-upgrade needed after a single-member upgrade.** See section 6. This is inherent to how Odoo reloads a module's own XML and cannot be avoided from a separate module.
- **Uninstall does not restore the original menu positions.** See section 7.
- **The fate of the two folders on uninstall is unverified.** See section 7.
- **Fixed layout.** The order and grouping are defined in `views/odomate_hr_suite_menus.xml`. Changing them means editing that file and upgrading the module; there is no settings screen for it.
- **No demo data.** A data-only meta-module ships none.
