1. Overview

This module adds three printable accounting books to **Accounting → Reporting → Audit Reports**:

Report	What it lists	Journals covered
Day Book	Every journal item of the period, grouped into one block per calendar day	All journal types
Cash Book	Cash movements per account, with running balance	cash journals
Bank Book	Bank and credit card movements per account, with running balance	bank and credit journals

All three are **read-only**. They never create, modify or delete a record, so they are unaffected by lock dates and can safely be run by a read-only accountant.

The module reuses the shared filter dialog, page header and landscape paper format of **Accounting Audit Reports** (`odomate_account_ledger_reports`), so all six reports look and behave consistently.

The printed header — company, period, journals, and the Entries selection (Posted Entries Only / All Entries) — displays in your session's language, using this module's own translations (`uk`, `pl`, `de`, `es`, `fr`, `pt_BR`).

2. Installation

1. Copy `odomate_account_daily_reports` into your Odoo addons path.
2. **Apps** → **Update Apps List**.
3. Search for Accounting Daily Reports and click **Install**.

`account` and `odomate_account_ledger_reports` are installed automatically if they are not present yet.

3. Who can use it

The three menus and the three dialogs are available to:

- `account.group_account_manager` — Accounting Administrator
- `account.group_account_user` — full accounting features
- `account.group_account_readonly` — read-only accounting

Users with only `account.group_account_invoice` (Invoicing) get no menu and no access: printing raises "Only accounting users can print accounting reports."

The module creates **no new security group** and modifies no user.

4. Day Book

Accounting → **Reporting** → **Audit Reports** → **Day Book**

Field	Meaning
Entries	Posted Entries Only or All Entries (adds drafts). Cancelled entries never appear.
Start Date / End Date	Both are required . They default to today.
Journals	Leave empty to cover every journal of the company.
Company	Visible in multi-company setups.

Click **Print** to get the PDF, or **Cancel** to close.

The printout groups items into one block per day. Columns are Journal, Entry, Partner, Reference, Label, Debit, Credit, Difference (plus Currency for multi-currency users). Each day closes with a **Day total** row, and the report closes with a **Total** row.

Days with no items produce no block — the report never prints an empty day. If nothing matches, the PDF says "No entries in this period."

The Day Book has **no opening balance and no running balance**: it is a chronological recap, not a ledger.

5. Cash Book

Accounting → Reporting → Audit Reports → Cash Book

Same filters as the Day Book, plus:

Field	Meaning
Sort by	Date or Journal and Partner — changes the order of the items inside each account.
Display Accounts	All Accounts, With Movements (default), or With Balance Not Equal To Zero.
Include Opening Balance	Prints an Opening Balance row per account. Requires a Start Date.
With Currency	Adds the Currency column. Only visible to users in Multi-Currency .

The **Journals** field only accepts cash journals. Picking a bank journal raises "This book only covers cash journals."

The printout has one block per account, ordered by account code, with columns Date, Journal, Entry, Partner, Reference, Label, Debit, Credit, Balance. Each block closes with an **Account total** row; the report closes with a **Total** row.

Which accounts appear

The Cash Book does not simply list "everything the cash journals touched". It resolves the account set from:

- each journal's **default account** and **suspense account**,
- each journal's **outstanding receipts / outstanding payments** accounts,
- plus every `asset_cash` account actually touched by an item in the period.

Accounts belonging to another company are dropped. This means a cash journal with no default account configured still prints correctly.

6. Bank Book

Accounting → Reporting → Audit Reports → Bank Book

Identical to the Cash Book, except that it covers **bank** and **credit card** journals, and its account set also includes `liability_credit_card` accounts. Picking a cash journal raises "This book only covers bank and credit card journals."

7. How the figures are computed

Opening balance

With **Include Opening Balance** ticked, the opening row sums everything booked on that account **before the Start Date**, using the same fiscal-year-correct rule as the General Ledger of Accounting Audit Reports. For cash and credit card accounts — which always carry their balance forward — this is simply every earlier item.

Running balance

The **Balance** column is a true running total per account:

$$\text{balance of a row} = \text{balance of the previous row} + \text{this row's debit} - \text{this row's credit}$$

The first row starts from the opening balance, or from zero when the opening is not printed.

Closing balance

$$\text{Account total} = \text{Opening} + \Sigma \text{ debit} - \Sigma \text{ credit}$$

It is summed from the items, never read off the last row.

Worked example

Account **101100 Cash A**, period 01/03/2024 → 31/03/2024, opening balance ticked.

Row	Debit	Credit	Balance
Opening Balance	1,000.00	0.00	1,000.00
05/03/2024 CASH-IN	200.00	0.00	1,200.00
10/03/2024 CASH-OUT	0.00	50.00	1,150.00
Account total	200.00	50.00	1,150.00

Check: $1,000.00 + 200.00 - 50.00 = 1,150.00$.

The same period in the Day Book, for 05/03/2024 — a 200.00 cash receipt and a 300.00 bank receipt:

	Debit	Credit	Difference
Day total	500.00	500.00	0.00

In a balanced ledger the **Difference** column is always 0.00; a non-zero value points at an unbalanced entry.

Currency

Every figure is printed in the **company currency** — nothing is converted. The optional Currency column shows the item's own amount in its own currency whenever that currency differs from the company currency, negative amounts included.

8. Multi-company

Each printout covers exactly one company — the one chosen in the dialog. Items of other companies never appear. Choosing a company you are not allowed to work in raises "You cannot print a report for a company you are not allowed to work in."

The four dialog models are transient and hold no company data of their own, so no record rule is needed: the company filter lives in the validation step and in every domain.

9. Limitations

- **PDF and HTML only.** There is no XLSX or CSV export, and no interactive on-screen version.
- **No drill-down.** The PDF is a printout; clicking a figure does not open the underlying entry.
- **One company per printout.** Consolidated multi-company books are not supported.
- **No currency conversion.** Foreign-currency items are shown at their booked company-currency value; the report does not re-translate them at a chosen rate.
- **No analytic columns.** Use the General Ledger of Accounting Audit Reports if you need analytic distribution.
- **The Day Book has no balances** by design — use the Cash Book or Bank Book for running and closing balances.
- **No demo data.** These reports print whatever your database already contains.
