

Project Task Checklists — User Guide

Reusable, step-by-step checklists for Odoo **Project** tasks, with per-task customization, live progress tracking, and automatically stamped start/end dates.

10. Limitations

1. Overview

This module lets you define checklist **templates** (a named list of steps) once, then attach them to any project task. When a template is applied, its steps are copied onto the task as an **independent copy** — you can add, delete, rename, re-order, and mark steps without ever affecting the source template.

Each task shows a progress bar next to its **End Date**, and two dates fill themselves in as work happens: the **Start Date** stamps when the first step begins, and the **End Date** stamps when everything eligible is done.

2. Installation

1. Copy the `project_checklist` folder into your Odoo addons path.
2. Enable **Developer Mode**, then update the Apps list.
3. Search for **Project Task Checklists** and click **Install**.

The module depends on **Project** (`project`); Odoo installs it automatically if needed.

3. Building Checklist Templates

Go to **Project** → **Configuration** → **Checklists**.

- The list shows each template's **Name** and its **Step Count**.
- Open or create a template. Give it a name (e.g. New Client Onboarding) and an optional description.
- In the **Steps** tab, add rows. Each step has a **Name**, an optional **Note**, and a drag handle (::) to re-order them. Order is stored in the `sequence` field.

Only **Project Managers** can create or edit templates. Every internal user can read them, so anyone can pick a template when working on a task.

Three ready-to-use templates ship as demo data: New Client Onboarding (5 steps), Website Launch Checklist (4 steps), and Employee Offboarding (4 steps).

4. Applying a Checklist to a Task

Open any task (**Project → Tasks**). Near the deadline you'll find the **Checklist** picker, followed by **Start Date**, **End Date**, and a **progress bar**.

- Pick a template on a task with **no checklist yet** (or one where every step is still To Do): the steps copy in immediately as To Do. No confirmation is needed. This works both on a saved task and while filling out a **brand-new** task — the steps are copied in as soon as you save.
- A new **Checklist** tab appears as soon as steps exist, and the progress bar next to **End Date** appears with it.
- The progress bar lives in the task's main info area, not inside the **Checklist** tab — it stays visible no matter which tab (Description, Sub-tasks, Checklist, ...) is currently open.

5. Working Through the Steps

In the **Checklist** tab, each step row shows the drag handle, name, note, a **Status** field, and three inline buttons. (The progress bar itself is not in this tab — see Progress and Automatic Dates.)

Button	Appears when	Sets status to
Start	status is To Do	In Progress
Done	status is To Do or In Progress	Done
Cancel	status is To Do or In Progress	Cancelled

Rows are color-coded: **green** for Done, **red** for Cancelled, **orange** for In Progress, default for To Do.

The **Status** field itself stays editable, so you can correct an accidental click (for example, set a Done step back to In Progress).

You can also freely add ad-hoc steps, delete steps, or rename them — the task's checklist is entirely its own copy.

6. Progress and Automatic Dates

Progress = done steps ÷ eligible steps × 100, where eligible excludes **Cancelled** steps. So cancelling a step can never hold progress below 100%.

Worked example — a 4-step checklist:

Step	Status
Review Content	Done
Test on Mobile	Done
Configure Analytics	Cancelled
Point DNS	Done

Eligible steps = 3 (the cancelled one is excluded). Done = 3. Progress = $3 \div 3 \times 100 = 100\%$.

Start Date — the first time any step moves to In Progress, today's date is written to **Start Date** if it was empty. It is never overwritten afterward (it belongs to the task's own timeline) and is always manually editable.

End Date — when progress reaches exactly 100%, today's date is written to **End Date** if it was empty. If a later change drops progress back below 100% (you add a step, or reopen a done one), the End Date is **cleared automatically** so it can re-stamp honestly on the next real completion. An all-cancelled checklist has no eligible steps, so it never stamps an End Date.

On the task form, the progress bar sits next to **End Date** in the main info area (not inside the Checklist tab), so it stays visible while you switch between tabs. The task **list view** also includes a **Checklist Progress** column (progress-bar widget) so completion is scannable without opening each task.

7. Switching or Replacing a Checklist

If a task's checklist already has progress (any step not To Do) and you pick a different template, the change is **not** applied silently. A **Replace Checklist** button appears next to the picker. Clicking it opens a confirmation dialog summarizing how many steps will be deleted and which template will replace them.

- **Replace** — deletes the current steps and copies the new template fresh (all To Do). The **End Date** is cleared (the task is incomplete again); the **Start Date** is left as-is.
- **Cancel** — leaves the task's checklist untouched and reverts the **Checklist** picker back to the currently applied template, so the picker and the steps always stay in sync.

8. Security & Access

Model	Internal User	Project Manager
<code>project.checklist.template</code>	Read	Full
<code>project.checklist.template.line</code>	Read	Full

<code>project.task.checklist.line</code>	Full	Full
<code>project.task.checklist.replace.wizard</code>	Full (transient)	Full

A record rule on `project.task.checklist.line` mirrors task visibility: a step is never visible to a user who cannot see its task. Managers see all task checklist steps, matching their task access.

9. Field Reference

`project.task.checklist.line`

Field	Type	Notes
<code>name</code>	Char	Required
<code>note</code>	Text	Optional
<code>sequence</code>	Integer	Drag-handle ordering
<code>state</code>	Selection	to_do / in_progress / done / cancelled
<code>task_id</code>	Many2one	The task (onDelete cascade)
<code>template_line_id</code>	Many2one	Source template step (traceability only)

`project.task` (added fields)

Field	Type	Notes
<code>checklist_template_id</code>	Many2one	The picker
<code>checklist_line_ids</code>	One2many	The task's own steps
<code>checklist_progress</code>	Float (stored)	0–100, cancelled steps excluded
<code>date_start</code>	Date	Auto-stamped on first In Progress
<code>date_end</code>	Date	Auto-stamped at 100%, self-clearing

10. Limitations

- **No per-step assignment.** The task's existing assignee owns all steps.
- **No notifications.** Step changes send no emails or reminders (out of scope for v1).
- **Templates are global.** There is no per-company isolation of templates.
- **Editing a template is not retroactive.** Tasks keep the independent copy they received when the checklist was applied.
- **No dashboards/reports** beyond the on-task and in-list progress bars.
