

OdoMate HR Resignation & Clearance — User Guide

Resignation and exit clearance tracking for the Odoo 19 **Employees** app, gated on outstanding company property read live from `odomate_hr_custody`.

Table of contents

1. What this module does
2. Installation
3. Configuration
4. The resignation workflow
5. The exit clearance checklist
6. Releasing an employee
7. Exit interview
8. Who can see and do what
9. The daily scheduled action
10. Field reference
11. Limitations

1. What this module does

It adds three configurable records to the Employees app:

Model	Purpose
<code>odomate.hr.resignation</code>	One resignation per employee, from notice to release
<code>odomate.hr.clearance.item</code>	The reusable checklist entries (IT Accounts, Finance, ...)
<code>odomate.hr.resignation.clearance.line</code>	One checklist entry attached to one resignation

The single idea that shapes the whole module: **an employee is not released while the custody register still shows company property in their hands**. That register (`odomate.hr.custody`) is read, never written — this module never marks anything as returned.

2. Installation

`odomate_hr_custody` is a hard dependency. The module also pulls in `hr`, `mail` and `survey`. Install from

Apps → Update Apps List → OdoMate HR Resignation & Clearance.

No new security groups are created. The module reuses `hr.group_hr_user` (HR Officer) and `hr.group_hr_manager` (HR Manager), so anyone who already administers Employees can use it the moment it installs.

3. Configuration

3.1 Manager approval

Settings → Employees → Resignation & Clearance → Manager Approval on Resignations (field `resignation_manager_approval_required`, per company, **on by default**).

- **On** — a confirmed resignation waits for the employee's manager (`employee_id.parent_id.user_id`) before HR opens the clearance.
- **Off** — HR approval moves the record straight from `confirmed` to `clearance`; the `manager_approved` step is skipped entirely.

3.2 Clearance items

Employees → Configuration → Clearance Items (HR Manager only).

Five starter items ship with the module and are available to **every** company because their Company field is left empty:

Sequence	Name
10	IT Accounts
20	Company Property
30	Handover Notes
40	Finance
50	Keys & Passes

They are ordinary records — rename, reorder, archive or delete them. Nothing in the code depends on them existing, with one exception noted in section 5.

Set **Default Responsible** to route an item to a specific user. Leave it empty and the line falls back to the HR user who approved the resignation. Leave **Company** empty to share the item across companies; set it to pin the item to one company.

4. The resignation workflow

Employees → Resignations. The list opens filtered to `In Progress` (draft / confirmed / manager approved / clearance). The `Released`, `Refused` and `Withdrawn` filters are one click away — nothing is hidden permanently.

```
draft → confirmed → manager_approved → clearance → released
```

↘ refused

↘ withdrawn (any time before released)

4.1 Draft

Pick the **Employee**; Department and Job Position fill in automatically. Enter the **Notification Date**, the **Reason** and the **Departure Reason** (the standard `hr.departure.reason` records — no parallel list is introduced).

Notice Period (Days) is read from the employee's current `hr.version` record at this moment and stored on the resignation. **Proposed Last Working Day** = Notification Date + Notice Period.

Worked example. Rita gives notice on 8 September 2026. Her current version carries a 30-day notice period, so Proposed Last Working Day is **8 October 2026**, and Last Working Day is set to the same date.

HR later negotiates 20 October and types it into **Last Working Day**. From that instant the record is flagged as manually set. If the Notification Date is afterwards corrected to 10 September, Proposed Last Working Day moves to 10 October — but Last Working Day stays at **20 October**. There is no value-comparison guessing: one boolean, set the moment a human writes the field.

4.2 Confirm

Confirm moves the record to `confirmed` and raises a To-Do activity. If manager approval is required for the company and the employee has a manager with a user account, the activity goes to that manager ("Approve the resignation of Rita Resigner"). Otherwise it goes straight to the HR responsible.

4.3 Manager Approve

Visible while the record is `confirmed`. It can be run by the employee's own manager or by any HR officer. It closes the pending approval activity, moves to `manager_approved`, and raises a new activity on HR ("Start the exit clearance for ...").

4.4 Approve (HR)

Available to HR from either `confirmed` or `manager_approved`. It fixes the Last Working Day if it is still empty, builds the clearance checklist, and moves the record to `clearance`. See the next section.

4.5 Refuse and Withdraw

Refuse (HR, before HR approval) opens a small wizard that demands a reason. On confirm it cancels every open approval activity, stores the text in **Refusal Reason** and sets the state to `refused`.

Withdraw is available to anyone who can see the record, at any point before `released`. It cancels open activities and sets `withdrawn`. It leaves the employee record completely untouched — no departure date, no archiving.

Both are terminal. Because the uniqueness rule only counts resignations that are neither refused nor withdrawn, a refused or withdrawn record frees the employee to have a new one recorded.

5. The exit clearance checklist

HR approval builds one line per active clearance item visible to the resignation's company (its own items **plus** the global blank-company ones), in sequence order. Each line gets a To-Do activity on its responsible user.

5.1 The property snapshot line

If the custody register shows anything `approved` for this employee at the moment of HR approval, **one additional line** is created in the `blocked` state on the Company Property item. Its remark names every outstanding item, its handover reference and its due date:

```
Company property still registered to this employee when HR approved  
the resignation:  
- Projector (handover HO/2026/0007, due 2026-09-18)
```

This is a **snapshot**. It is deliberately not refreshed. The authoritative check happens again at release time (section 6), and the two are allowed to disagree — that disagreement is the signal that something changed after approval.

If no company property is outstanding, no such line is created at all.

If the Company Property item has been deleted and no clearance items exist at all, the snapshot line cannot be created; the module posts a note in the chatter saying so. The live release check is unaffected.

5.2 Working the checklist

Blocked lines are shown with a red badge and a red row in the embedded list, so they stand out from ordinary pending work. Above the list, a progress bar shows cleared lines ÷ total lines.

The responsible user can open their own line (from the activity in their inbox) and use **Mark as Cleared**, **Mark as Blocked** (a remark is mandatory) or **Reset to Pending**. HR officers can do the same on any line. Nobody else can, even if they somehow reach the record.

6. Releasing an employee

Release appears on a record in `clearance` for HR officers. It is a single, all-or-nothing step, blocked by two independent checks with distinctly worded messages:

1. **Live custody re-read.** `odomate.hr.custody` is queried again for `state = approved`. If anything comes back, the error names each item, its handover reference and its due date. This ignores the snapshot line — the live read wins.
2. **Checklist completeness.** Any line not in `cleared` blocks the release, and the error lists each open entry with its status and responsible user.

When both pass, in one transaction:

- `departure_date`, `departure_reason_id` and `departure_description` are written on the

employee (which stores them on the current `hr.version`),

- the current version's `contract_date_end` is set to the release date,
- the employee is archived,
- the linked login (`res.users`) is archived — this is the only place the module elevates privileges, and it does so for that single write.

Afterwards the record is **immutable in code, not merely read-only in the view**: `write()` rejects changes to the dates, the reason, the departure reason and the checklist, on the resignation and on its clearance lines alike.

7. Exit interview

The **Exit Interview** tab holds the survey picker plus **Exit Interview Sent** and **Exit Interview Answered** indicators. From `manager_approved` onward, **Send Exit Interview** opens the standard `survey.invite` wizard pre-filled with the chosen survey and the employee's contact.

The answer is located by matching the selected survey against the employee's partner, so **Open Answer** works even if the invitation was sent from the Surveys app rather than from here.

8. Who can see and do what

Role	Resignations	Clearance items	Clearance lines
HR Officer (<code>hr.group_hr_user</code>)	read / write / create, all state transitions	read only	read / write / create
HR Manager (<code>hr.group_hr_manager</code>)	the above + delete	full configuration	the above + delete
The resigning employee's own manager	read / write that one record only	read only	—
Any other internal user	nothing	read only	only lines they are responsible for

There is **no menu entry** for resignations outside HR. A manager reaches the one record they are entitled to through the approval activity in their inbox; the record rule `[('employee_id.parent_id.user_id', '=', user.id)]` means every other ordinary user matches zero rows.

Responsible users reach their clearance line the same way. The clearance-line form deliberately shows only the employee name, the item, the status and the remark — no field on it walks back into the parent resignation, so a responsible user never needs (nor gets) access to the rest of the file.

All three models carry multi-company record rules. Clearance items use the standard optional-company domain, so blank-company items are visible everywhere.

The module ships **zero** `res.groups` and `res.users` records.

9. The daily scheduled action

Settings → Technical → Scheduled Actions → "Resignation: release cleared employees" runs once a day. It picks up resignations in `clearance` whose Last Working Day has arrived or passed, and runs the **exact same two checks** as the Release button — the same method, no elevated bypass. Records that still have outstanding property or open checklist entries are skipped and retried the next day.

Activities are raised on state transitions only. The cron never re-notifies about a condition that simply persists.

10. Field reference

`odomate.hr.resignation`

Field	Type	Notes
<code>name</code>	Char	RES/2026/0001, from the <code>odomate.hr.resignation</code> sequence
<code>employee_id</code>	Many2one	required, editable in draft only
<code>department_id</code> , <code>job_id</code>	Many2one	related to the employee, stored for list and search
<code>date_notified</code>	Date	required, defaults to today
<code>notice_period_days</code>	Integer	computed + stored from <code>employee_id.version_id.notice_period</code>
<code>proposed_last_working_day</code>	Date	computed + stored, <code>date_notified</code> + <code>notice_period_days</code>
<code>last_working_day</code>	Date	editable; mirrors the proposal until edited
<code>last_working_day_manual</code>	Boolean	technical; <code>True</code> the instant a human writes the field
<code>reason</code>	Text	required
<code>departure_reason_id</code>	Many2one	required, standard <code>hr.departure.reason</code>
<code>state</code>	Selection	draft / confirmed / manager_approved / clearance / released / refused / withdrawn
<code>outstanding_property_count</code>	Integer	computed, not stored — live custody count
<code>clearance_progress</code>	Float	computed, not stored — <code>cleared ÷ total</code> , as a percentage

`odomate.hr.resignation.clearance.line`

Field	Type	Notes
-------	------	-------

clearance_item_id	Many2one	required
employee_id, company_id	Many2one	related to the resignation, stored
responsible_user_id	Many2one	required; from the item, else the approving HR user
state	Selection	pending / cleared / blocked
remark	Text	mandatory before a line can be marked blocked

11. Limitations

Honest scope notes for v1:

- **No "reset to proposed" action.** Once Last Working Day is set by hand it stays that way. Clearing `last_working_day_manual` requires a developer or the Odoo shell.
- **The custody register is read-only here.** Releasing an employee does not mark their custody records returned; somebody must do that in `odomate_hr_custody` first, or the release stays blocked. That is deliberate.
- **User archiving is skipped in two cases** — when the linked login is the Odoo superuser, or when it is the very user pressing Release. Odoo forbids both writes; everything else in the release still completes.
- **No contract end date without a contract start date.** `hr.version` has a database check constraint that forbids it, so when the current version has no start date the module skips that write and posts a chatter note instead.
- **Demo resignations are attached at load time**, not by static XML ID, because demo employee XML IDs differ between Odoo builds. They bind to whichever demo employees the database actually has, with the property-blocked line copied from the live custody demo record.
- **Clearance item names are plain `Char` fields.** Following Odoo 19 guidance they are not marked `translate=True` (that switches storage to JSONB and causes display bugs), so the Ukrainian entries for the five starter names in `i18n/uk.po` are record names, not field labels, and only ever show in Ukrainian if that specific record's `name` value itself is translated by an administrator — the shipped `.po` entry is a reference translation, not a live one.
- **Ukrainian (`uk`) is the only shipped language pack.** On an install with language `uk_UA`, every field label, both menu items (**Resignations** and **Clearance Items**), all seven resignation states, all three clearance-line states, every button and every validation/activity message raised from Python render in Ukrainian. There is no `.pot` template shipped in the module — only the finished `i18n/uk.po` — so translators extending this to another language should generate a fresh template from **Settings → Translations → Export Translations** rather than looking for one on disk.
- **Out of scope entirely:** settlement, payslips, dismissal workflows, a handover-task model, exit-interview reporting, employee self-service and document generation.
